SECOND OPINION PROJECT

DON'T BELIEVE US? GO ASK YOUR OWN DOCTOR.

We understand that there is a lot of seemingly conflicting information going around about COVID-19, and that it's hard to know what to trust. Therefore, we believe that if you still aren't sure, you should ask your own doctor the following questions.

- **What is the risk for myself and my family (household) to contract COVID-19?**
- **What is my real risk if we look at my comorbidities? What are my comorbidities?**
- **What are the real risks for the members of my family if we look at comorbidities?**
- **Is it safe for me to go visit my parents or safe for my child to go visit grandparents? (Your doctor can help you assess and make the best decision.)**
- **How can I protect myself from getting sick? What are the most effective basic hygiene practices we can implement, both at home and while we are out, and not necessarily just for COVID-19?**
- **The CDC has changed its stance about whether or not the virus can live on surfaces. What is the truth? Do I have to be worried about touching the mail, deliveries, or items in the store? Do I need to disinfect surfaces regularly, and if so, how often?**
- **Dr. Fauci and others have also changed their stance on the use of masks more than once. Currently, they are saying that masks are mostly symbolic. What is the truth, and should I or any of my family members be wearing masks when we go out?**
